The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including thintis, urticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                             The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising S'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, uritaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the
                                                                                                                                                                                      Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.

The invention relates to an oligonuclectide molecule (ON) labeled with several fluorophores of one or more types embedded in its backbone, where one or more of the fluorophores is not located at either the 3' or 5' terminus of ON. ON is useful for sequencing nucleic molecules. ON is useful for detecting biological molecules e.g., antibody, antigen,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                         The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, uriticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. This sequence represents an oligonucleotide used in the
                                 Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel oligonucleotide molecule labeled with several fluorophores, useful for detecting biological molecules e.g., antibody, antigen, avidin or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The method comprises converting the RNA into circularized cDNA suitable for amplification by rolling circle replication, and transcribing the amplified cDNA into RNA, resulting in amplified RNA. The RNA is incubated with a primer, where the primer provides a predetermined nucleotide sequence at the 5' end of the cDNA. The primer is an isolated nucleotide acid molecule comprising a poly(AT) region, which comprises at least 5 thymidine residues. It is also an isolated nucleic acid molecule comprising a promoter region, where the nucleotide sequence is capable of initiating transcription. The method is useful for amplifying RNA obtained from a subject. It is preferably useful in expression analysis, e.g. analysis of complex tumor tissues, embryonic material, and cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Amplifying RNA from a subject, useful for expression analysis, by converting RNA into circularized cDNA suitable for amplification by rolling circle replication, and transcribing the amplified CDNA into RNA, resulting in amplified RNA.
            18
avidin, protein, peptide, bacteria, virus, blood cell or hormone. ON capable of providing strong fluorescence signals at different wavelengths. This sequence corresponds to an example of an

The present invention relates to a method for augmenting T-helper 1 cells (Th1)-like immune activation in a subject. The method comprises administrating an immunostimulatory nucleic acid (I) to induce Th1-like immune activation; and administrating a cyclooxygenase inhibitor (II) to inhibit prostaglandin expression, is new. The present sequence is one such immunostimulatory nucleic acid. (I) is useful for treating nonallergic inflammatory diseases such as psoriasis, inflammatory bowel diseases (Crohn's disease and ulcerative colitis), eczema, allergic

                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for augmenting T-helper 1 cells (Th1)-like immune activation in a subject. The method comprises administrating an immunostimulatory nucleic acid (1) to induce Th1-like immune activation; and administrating a cyclooxygenase inhibitor (II) to inhibit prostaglandin expression, is new. The present sequence is one such immunostimulatory nucleic acid. (I) is useful for treating non-allergic inflammatory diseases and ulcerative colitis), eczema, allergic contact dermatitis or latex dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunostimulant; Antiinflammatory; Antipsoriatic; Gastrointestinal-Gen.; Antiulcer; Dermatological; Antiallergic; helper T-lymphocyte; immune stimulation; inflammation; psoriasis; inflammatory bowel disease; Crohns disease; ulcerative colitis; eczema; skin allergy;

The present invention relates to a method for augmenting T-helper 1 cells (Th1)-like immune activation in a subject. The method comprises administrating an immunostimulatory nucleic acid (I) to induce Th1-like immune activation, and administrating a cyclooxygenase inhibitor (II) to inhibit prostaglandin expression, is new. The present sequence is one such immunostimulatory nucleic acid. (I) is useful for treating nonallergic inflammatory diseases such as psoriasis, inflammatory bowel diseases (Crohn's disease and ulcerative colitis), eczema, allergic
                                                                                                                                                                                                                                                                                                                 Use of an immunostimulatory nucleic acid and a cyclooxygenase inhibitor to augment T-helperl cells like immune activation and to treat non-allergic inflammatory diseases, e.g. psoriasis and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Incyte clone 1; fluorescent label; probe; primer; DNA sequencing; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   '*tag= a

                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                       The present sequence exxemplified the primer of the invention, and is used to sequence Incyte clone 1 (AAV42737). The primer of the invention is labelled with a set of at least 2 different fluorescent labels. The set comprises an energy-transfer fluorescent label with at least 1 each of a donor fluorophore and an acceptor fluorophore capable of energy transfer, and separated by a distance x, and a second similar fluorescent label in which the separation distance is y, x and y being sufficiently different for the two fluorescent labels to produce distinct fluorescent signals. Fluorescent labels are useful in multicomponent analyses, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       associated protein 1; Napl; human; apoptosis; Alzheimer's disease;
                                                                                                                                                                                                Set of energy-transfer fluorescent labels with donor and acceptor at different separations - useful for DNA sequencing allows use of fewer analysing wavelengths or an increased throughput.
                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The calix(4)arene-oligonucleotide hybrid functions as a DNA hairpin structure mimic. It effectively recognises DNA or RNA through triplex formation by bonding between the calix(4)arene-containing cavity and a biologically active substance. The hybrid has a certain level of both rigidity and flexibility, is stable in vivo, has high cell permeability and can be mass-produced. It can be used as a DNA sensor or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New calix(4) arene-nucleoside hybrid useful in gene therapy has at least one nucleoside attached to a calix(4) arene group through amide bonding, and is derived from a calix(4) arene having amino groups.

The invention relates to a synthetic mammalian (retro)transposon ORF2 or ORF1 gene exhibiting a higher level of expression relative to a natural CC ORF1 gene. The invention also relates to a (retro)transposon Comprising the synthetic gene, a mammalian L1 crerotransposon comprising the synthetic gene, a recombinant vector construct comprising the synthetic gene, a eukaryotic cell transfected, cransformed or infected with the recombinant vector construct comprising the synthetic gene, a eukaryotic cell transfected, construct comprising the synthetic gene, a eukaryotic cell transfected, confidentifying a dealired gene, or its biologically active fragment, to the cells of a mammal, a composition comprising a cassette comprising the composition is useful for treating a genetic disorder in a cells. The composition is useful for treating a genetic disorder in a mammal such as hemophilia, Parkinsons disease, Pabry disease, confidentifying an uncharacterized gene, or its biologically active fragment, confidently disorders disease, cystic fibrosis, disease, denosine deaminase deficiency, alpha-antitrypsin confidency, buchenne muscular dystrophy, phenylectonuria, sickle cell diseases. This sequence represents a murine DNA oligonucleotide used in

The invention relates to a synthetic mammalian (retro)transposon ORF2 or ORF1 gene exhibiting a higher level of expression relative to a natural inferro)transposon ORF2 or ORF1 gene. The invention also relates to a cretro transposon comprising the synthetic gene, a mammalian Liretro)transposon comprising the synthetic gene, a mammalian Liretrotransposon comprising the synthetic gene, a recombinant vector construct comprising the synthetic gene, a ewkaryotic cell transfected, transformed or infected with the recombinant vector construct, a method of delivering a desired gene, or its biologically active fragment, to the cells of a mammal, a composition comprising a cassette comprising the gene, desired gene and a pharmaceutical carrier, and a method of identifying an uncharacterized gene, or its biologically active fragment, in cells. The composition is useful for treating a genetic disorder in a mammal such as hemophilia, Parkinsons disease, Fabry disease, hypercholesterolemia, Gauchers disease, cystic fibrosis, adrenoleukodystrophy, disorders associated with mutations in the dystrophin gene, adenosine deaminase deficiency, alpha-antitrypsin anemia, Tay Sachs disease, thalassemia, lysosomal storage diseases and metabolic disorders. The synthetic gene is useful for treating the charactering an emaia, Tay Sachs disease, thalassemia, lysosomal storage diseases and the contraction of the charactering the characterin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tay Sachs disease; thalassemia; lysosomal storage disease; metabolic disorder; antilipemic; metabolic disorder; antilipemic; CNS-Gen.; respiratory-gen.; antilanemic; cerebroprotective; muscular-gen.; dermatological; nootropic; antisickling; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New synthetic mammalian (retro)transposon open reading frame 2 (ORF2) or ORF1 gene exhibiting a higher level of expression relative to a natural L1 (retro)transposon ORF2 or ORF1 gene, useful for treating e.g.,

```
The invention relates to a synthetic mammalian (retro) transposon ORF2 or ORF1 gene. The invention also relates to a natural L1 (retro) transposon ORF2 or ORF1 gene. The invention also relates to a (retro) transposon comprising the synthetic gene, a mammalian L1 construct comprising the synthetic gene, a recombinant vector or tetrotransposon comprising the synthetic gene, a recombinant vector construct comprising the synthetic gene, a recombinant vector construct comprising the synthetic gene, a casentrock a method of delivering a desired gene, or its biologically active fragment, to the cells of a mammal, a composition comprising a cassette comprising the gene, a desired gene and a pharmaceutical carrier, and a method or identifying an uncharacterized gene, or its biologically active fragment, in cells. The composition is useful for treating a genetic disorder in a mammal such as hemophilia, Parkinsons disease, Fabry disease, hypercholesterolemia, Gauchers disease, rebry disease, cystic fibrosis, adrenoleukodystrophy, disorders associated with mutations in the deficiency, buchenne muscular dystrophy, phenylectonuria, sickle cell metabolic disporders. The synthetic gene is useful for treating the chases and metabolic disporacers. The synthetic gene is useful for treating the diseases. This sequence represents a murine DNA oligonucleotide used in the cope of the invention.
                                                                                                                                                                                                                                                                               Transposon; retrotransposon; genetic disorder; hemophilia; Parkinsons disease; Fabry disease; hypercholesterolemia; Gauchers disease; cystic fibrosis; adrenoleukodystrophy; adenosine deaminase deficiency; alpha-1 antitrypsin deficiency; Duchenne dystrophy; phenylketonuria; sickle cell anemia; Tay Sachs disease; thalassemia; lysosomal storage disease; metabolic disorder; antiparkinsonlan; hemostatic; metabolic; antilipemic; CNS-Gen.; respiratory-gen.; antilianemic; cerebroprotective; muscular-gen.; dermatological; nootropic; antisickling; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New synthetic mammalian (retro)transposon open reading frame 2 (ORF2) or ORF1 gene exhibiting a higher level of expression relative to a natural Li (retro)transposon ORF2 or ORF1 gene, useful for treating e.g., metabolic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 1; SEQ ID NO 13; 66pp; English.

This invention describes a novel method (M1) for inserting a nucleic acid (N1) into a circular vector (V1) comprising joining ends of N1 and V1 under a first nucleic acid concentration, melting hybridized cohesive circularization ends, and reannealing the ends at a second concentration. The methods are useful for the cloning small amounts of nucleic acids and forming genomic libraries of complex populations of DNA or cDNA. The methods allow the cloning of minute amounts of nucleic acids efficiently and avoids the size selection problems of prior art systems. Larger nucleic acid fragments are just as easily cloned, allowing highly representative libraries to be made. Vector to vector ligation is avoided using the methods. AAA40351-A40366 represents primers used to illustrate
                                                                                                                                                                                                                                                                                                                                         Inserting a nucleic acid into a circular vector comprising joining their ends, melting, and reannealing ends at two different concentrations, useful for cloning small amounts of nucleic acids and forming genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 24; DB 1; Length 28;

Detecting an analyte in a sample comprises providing nucleic acid sequence which is catalytically active in presence of analyte, contacting catalytic nucleic acid with substrate and amplifying catalytic product.

The invention relates to a method of detecting an analyte in a sample

Disclosure; Page; 36pp; English.

```
Inserting a nucleic acid into a circular vector comprising joining their ends, melting, and reannealing ends at two different concentrations,
                                               ends, melting, and reannealing ends at two different concentrations, useful for cloning small amounts of nucleic acids and forming genomic
                                                                                                                                                                                                                                                                          ВР.

This invention describes a novel method (MI) for inserting a nucleic acid (NI) into a circular vector (VI) comprising joining ends of NI and VI under a first nucleic acid concentration, melting hybridized cohesive circularization ends, and reannealing the ends at a second concentration. The methods are useful for the cloning small amounts of nucleic acids and forming genomic libraries of complex populations of DNA or cDNA. The methods allow the cloning of minute amounts of nucleic acids efficiently and avoids the size selection problems of prior art systems. Larger nucleic acid fragments are just as easily cloned, allowing highly uspresentative libraries to be made. Vector to vector ligation is avoided the methods. AAA40331-A440366 represents primers used to illustrate Gaps ö Similarity 100.0%; Score 24; DB 1; Length 28; Similarity 100.0%; Pred. The method comprises providing an object of sequence which is initially catalytically inactive, but which becomes catalytically active in the presence of an analyte (the effector); providing a nucleic acid substrate for the catalytic activity of the nucleic acid sequence; and contacting the nucleic acid sequence and the substrate with the sample under conditions allowing catalytic activity of nucleic acid sequences. The conditions allowing catalytic activity of nucleic acid sequence will be able to convert the nucleic acid sequence will be able to convert the nucleic acid sequence will be able to convert the nucleic acid sequence will be able to convert the nucleic acid sequence will be able to convert the nucleic acid sequence will be able to convert the nucleic acid sequence will be able to convert the nucleic acid sequence will be able to convert the nucleic acid product only if the analyte of interest is present. The nucleic acid acadalytic product indicates the presence of an analyte in a sample in diagnostic cassays. The invention describes the in vitro selection of a ribozyme ligase (II; AAA57859, AAA57860) which is catalytically active only in the presence of an oligonucleotide effector (AAA57854). The Li ribozyme ligase was selected from a pool of RNA molecules comprising a central constant sequence regions (the NBO RNA AB57851). In the presence of the activity of the activi

28 AAAAAAAAAAAAAAAAA S

of the effector, selection was performed using one of the targets substrate molecules AAA57855-A57857. RNAs with ligase activity (i.e., those which have become ligated to the substrate molecule) were reverse transcribed using the effector oligo, and then PCR amplified using the effector and a DNA primer identical in sequence to the substrate used for the selection. A ribozyme ligase, ii, was selected via this procedure. Ligan only adopt its active conformation (AAA57859) in the presence of the effector oligo (analyte). In the absence of the effector, ii adopts an inactive conformation (AAA57860). The present sequence represents the decoxy-T22-tagged substrate oligonucleotide. The dT22 tag enables successfully ligated products to be isolated using oligo(AA) cellulose Type 7. Note: The present sequence is not given in the specification, but

                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents an oligonucleotide used in an example of the present invention. The present invention describes a method for synthesising a selected oligonucleotide (1) having well defined ends. The method comprises: (a) annealing a primer to a single-stranded (ss) circular template to yield a primed circular template, where the template comprises: (i) at least one nucleotide sequence complementary to (1); and (ii) at least one nucleotide effective to produce a cleavage site in the oligonucleotide multimer; (b) combining the primed circular template with at least two types of nucleotide triphosphates and a polymerase enzyme with the addition of auxiliary proteins to yield a ss oligonucleotide multimer complementary to the circular oligonucleotide template, comprising multiple copies of (1); and (c) cleaving the oligonucleotide
                                                                                                                                                                                    The present invention relates to a triplex forming oligonucleotide which specifically binds to a specific gene. This is useful for the gene therapy of cancer by binding itself to Auger electron emitters. The present sequence is a triplex forming oligonucleotide of the invention
                                                                                                    Novel triplex forming synthetic oligonucleotide, useful for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rolling circle synthesis of oligo:nucleotide(s) - using primed circular template to produce oligonucleotide multimer for cleavage.
                                                                                                                                                                                                                                                                                                                                           Gaps

The circular template was used for the synthesis of the oligomer dT12 in an example of the method of the invention for synthesising an RNA oligonucleotide, comprising combining a single-stranded circular oligonucleotide template comprising at least one copy of a nucleotide sequence complementary to the sequence of the desired RNA oligonucleotide with at least 2 types of ribonucleotide triphosphate and a polymerase enzyme to yield a single-stranded RNA oligonucleotide multimer comprementary to the circular oligonucleotide template, where the RNA oligonucleotide multimer comprises multiple copies of the desired RNA oligonucleotide. The methods can be used for producing RNA oligonucleotides having a specific sequence and well defined ends. The RNA oligonucleotides produced can be used as probes, standards and
                                                                                                                                                                                                                                           ö
multimer at the cleavage site to produce (I) having well defined ends. The method is used for the large-scale synthesis of DNA and RNA oligomers for use, e.g. as probes and diagnostic agents and/or therapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /*tag= b

The present invention describes a detectably labelled oligonucleotide multimer, comprising multiple contiguous copies of a repeated oligonucleotides. The detectably labelled oligonucleotide multimer is useful for detecting a target molecule. Oligonucleotide multimers may be produced in sufficient quantity to be useful for diagnostic and medical applications. The multimers are useful for affinity labelling of proteins, and for signal amplification in highly sensitive affinity capture and sequence identification in highly sensitive affinity faster, cheaper and simpler way for large-scale production of DNA and RNA oligomers and multimers. The incorporation of labels enables the oligonucleotide multimers to be useful in diagnostics and medicine. The
                                                                   Revised record issued on 21-OCT-2004 : Correction to feature table key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New detectably labelled oligonucleotide multimer, comprising multiple contiguous copies of a repeated oligonucleotide - useful for detecting target molecules in diagnosis and medicinal applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present sequence represents an oligonucleotide used in an example from the present invention
diagnostic or therapeutic agents. They can be used for modifying the structure or function of a target molecule. They can also be used to cleave disease-associated RNA, DNA or protein

oligonuclectide, comprising combining a single-stranded circular oligonuclectide, comprising combining a single-stranded circular oligonuclectide template with at least two types of ribonucleotide triphosphate and a polymerase enzyme to yield a single-stranded RNA oligonuclectide multimer comprises multiple template, where the RNA oligonuclectide multimer comprises multiple copies of the desired RNA oligonuclectide. The method is useful for synthesising an RNA oligonuclectide with well-defined ends. The circular oligonuclectide is introduced into the cell using direct injection, calcium phosphate treatment, lipid-mediated delivery, or cation-mediated delivery. The method is useful for treating bacterial and/or viral infections in mammals, particularly drug resistant infections, and for producing double stranded DNA oligomers. The method is useful for treating addition of auxiliary proteins. This sequence represents an addition of auxiliary proteins. This sequence represents an oligonucleotide primer, or without the oligonucleotide used in the method of the invention. The invention relates to a method for synthesising an RNA

The invention relates to an isolated polypeptide with aminopeptidase activity and the gene encoding it (including sequences complimentary to the gene and which hybridise to it at high stringency), from Aspergillus niger. Also included are a nucleic acid construct comprising the above construct comprising the above polymucleotide operably linked to one or more control sequences that direct the production of the polypeptide in a suitable expression host, a recombinant vector comprising the above nucleic acid construct, a recombinant host cell comprising the above construct or vector, and producing the protein comprising the above construct or vector, and producing the protein comprising the above construct or vector, and producing the protein comprising the above construct or vector, and producing the protein comprising the above construct or the polypeptide and recovering the polypeptide. The aminopeptides is cheese to enhance the flavour. The invention provides a bacterial enzyme for protein chydrolysis i.e. with aminopeptidase activity, to produce flavouring agents, and the enzyme has been isolated and characterised, compared to a previously observed weak aminopeptidase activity which was detected in an Aspergillus niger culture filtrate but the source was never isolated or identified. The use of enzymes to produce flavouring agents from protein manager culture filtrate but the source was never isolated or dentified the amino acids obtained. The present sequence is a reverse transcriptase (RT)-PCR primer used to investigate the intron-exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                An isolated polypeptide with aminopeptidase activity, for preparing food compositions, such as bread and cheese, with enhanced flavoring.

New polypeptide having cellulolytic enhancing activity, useful for degrading or converting biomass to sugars and for producing organic substance and detergent composition.

Example 11; SEQ ID NO 43; 219pp; English.

The invention describes an isolated polypeptide (I) having cellulolytic enhancing activity. Also described are: producing a polymucleotide having a mutant nucleotide sequence, an isolated polymucleotide comprising a complexity sequence, an isolated polymucleotide compression by the method of (1); a nucleic acid construct comprising the complexity linked to one or more control sequences that direct the production of the polypeptide in an expression host or a conclectide sequence encoding a signal peptide consisting of nucleotides 330-387 of SEQ ID NO: 1, nucleotides 47-97 of SEQ ID NO: 3, nucleotides 69-125 of SEQ ID NO: 9, where the gene is foreign to the nucleotides sequence; a recombinant expression vector comprising the nucleotide sequence; a recombinant expression vector comprising the conclection construct of (3); producing (1); producing a mutant cell; a mutant cell produced by the method of (7); producing a protein; a transgenic plant, plant part or plant cell, which has been comprising the polypeptide having cellulolytic enhancing activity, a cellulolytic activity, and a surfaceant; degrading or converting a colludorytic phancing and producing an organic cubstance. (1) is a of 125, 478, 516, 452, or 608 amino acids (EVEN SEQ ID NOS: 2-10) encoded by a polynucleotide comprising a nucleotide sequence of 1846, 880, 1000, 681, or 960 bp (0DD SEQ ID NOS: 1-9). The polypeptide, polynucleotide, and methods are useful for degrading or converting biomass to sugars, for producing an organic substance, and for producing detergent composition. This sequence represents a primer used in the creation of a Thielavia terrestris NRRL 8126 cDNA library for the isolation of cellulolysis polypeptide having cellulolytic enhancing activity comprising a sequence of 326, 478, 516, 452, or 608 amino acids (EVEN SEQ ID NOS: 2-10) encode

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         XEXEXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA coligonucleotides (without a CPG motif.) which can stimulate an immune response in animals of the order of primate, including humans. The immune response is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendritic cells. The present in plasmacytoid dendritic cells. The present cinvention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ameliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA coligonucleotides (without a CPG motif), which can stimulate an immune coligonucleotides (without a CPG motif), which can stimulate an immune response in animals of the order of prinate, including humans. The immune response is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendrific cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, virtues, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or cells and glycolipids. As such, these DNA oligos can be used in gene comprised in munne system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is an immunostimulatory corrionate non-CPG variant DNA oligo, used to determine the effect of oligo size on B cell proliferation and ILG secretion in an exemplification of the invention. NOTE: This sequence is referred to as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cleavage of nucleic acids from solid supports assay oligonucleotide #1.
ss; non-CpG; immunostimulatory; non-palindromic; immune response; proliferation; differation; differation; B-cell; plasmacytoid dendritic cell; immunomodulator; gene therapy; chronic myelogenous leukaemia; melanoma; Kaposi's sarcoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                        요
                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                       Detaching nucleic acid molecule comprising unconventional nucleotide incorporated at predetermined site from a solid support involves cleaving the nucleic acid molecule at the site of unconventional nucleotide.
                                                                                                                                                                                                                                                                                 The present invention is concerned with the cleavage of nucleic acids from solid supports. This is carried out by adding a non-conventional nucleotide into the nucleic acid attached to the support, so that it is recognised and cleaved by a specific DNA glycosylase and the sequence is released. This is useful in many molecular biological procedures such as sequencing, in vitro amplifications, CDNA and template preparation, DNA-based assays, mutagenesis procedures, nucleic acid purification and affinity chromatography. The present sequence is an oligonucleotide used in assays to demonstrate the methods of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nucleic acids from solid supports assay oligonucleotide #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid cleavage, solid support, affinity chromatography; sequencing; mutagenesis; DNA preparation; nucleic acid purification;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Electrophoresis apparatus useful for isolating variant gene, comprises heating apparatus, and sealed flow path comprising linear polymer and DNA joint controlling agent, with DNA conjugates for separation, purification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises an electrophoresis apparatus for isolating variant genes. The apiarists consists of: a sealed flow path filled with buffer contealing linear polymer and DNA joint controlling agent, and containing DNA conjugate for separation, DNA conjugate for presention, DNA conjugate for present on the conjugate for assay, and a heating apparatus for heating the portion of sealed flow path in which the DNA conjugate for sasy is fixed. The electrophoresis apparatus is useful for isolating a variant gene. The electrophoresis apparatus is also useful in gene diagnosis for
Detaching nucleic acid molecule comprising unconventional nucleotide incorporated at predetermined site from a solid support involves cleaving the nucleic acid molecule at the site of unconventional nucleotide.
                                                                                                                                                                                                                                                       The present invention is concerned with the cleavage of nucleic acids from solid supports. This is carried out by adding a non-conventional nucleotide into the nucleic acid attached to the support, so that it is recognised and cleaved by a specific DNA glycosylase and the sequence is released. This is useful in many molecular biological procedures such as sequencing, in vitro amplifications, cDNA and template preparation, DNA-based assays, mutagenesis procedures, nucleic acid purification and affinity chromatography. The present sequence is an oligonucleotide used in assays to demonstrate the methods of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

ö
detecting the presence or absence of a gene mutation, or variant gene, and for single nucleotide polymorphism analysis. The present DNA sequence was shown in a figure exemplifying the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises an electrophoresis apparatus for isolating variant genes. The apiarists consists of: a sealed flow path filled with buffer containing linear polymer and DNA joint controlling agent, and containing DNA conjugate for separation, DNA conjugate for purification, and DNA conjugate for assay; and a heating apparatus for heating the portion of sealed flow path in which the DNA conjugate for assay is fixed. The electrophoresis apparatus is useful for isolating a variant gene. The electrophoresis apparatus is also useful in gene diagnosis for detecting the presence or absence of a gene mutation, or variant gene, and for single nucleotide polymorphism analysis. The present DNA sequence was shown in a figure exemplifying the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Electrophoresis apparatus useful for isolating variant gene, comprises heating apparatus, and sealed flow path comprising linear polymer and DNA joint controlling agent, with DNA conjugates for separation, purification
                                                                                                                                                            Gaps

This invention relates to a novel method for the characterisation of the activity of a compound on cell. The method involves receiving images of cells with a cellular activity and images of other cells treated with the compound, quantitatively characterising phenotypic attributes of the image of cells with a cellular activity to produce a target phenotype for the cellular activity and that of the image of other cells to produce a second phenotype for the compound, and comparing the two phenotypes to determine whether the compound, and comparing the two phenotypes to determine whether the compound possesses cellular activity. The invention may be useful for characterising cellular activity of a compound, for determining information about properties of substances based upon the information about structure of living or non-living cells exposed to substances. The invention is also useful for identifying promising multiple biological descriptors from a single cell markers or components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

```
repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic candidate polymorphic repeat. The computational methods (polymorphic conditions) in the sequences, powpous, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River CC syndromic Haussian diseases, fragile-X syndrome, Fredreich s ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs

Creating an insertional mutation in the germ line of an animal, useful for generating a mutation in an offspring of an animal, comprises introducing into an animal a nucleic acid molecule comprising a germ line
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a method of creating an insertional mutation in the germ line of an animal by introducing into an animal a nucleic acid molecule comprising a germ line specific promoter. The method is useful for generating a mutation in an offspring of an animal, or for isolating a nucleic acid from a genome of an offspring of an animal. The method may also be used to correct genetic defects in animals, especially humans. The nucleic acid is useful for generating mutations in a cell for assessing the frequency with which selected cells under go insertional mutagenesis for the generation of transgenic animals. This sequence represents a primer used to characterise the insertion site of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         L1/enhanced green fluorescent protein (EGFP) retrotransposon cassette
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                           Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking conference of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The Oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotypic caid samples, for e.g. to assess by association analysis the genotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include disease e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic craits also include symptoms of or suscoptibility to multifactorial clisease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, microorganism. The method is also useful in forensic investigations and microorganism. The method is also useful in forensic investigations and primer specific for a human SNP containing DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                             New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic acid sample.

The invention relates to a method of peptide-based transcript or genetic analysis comprising: (a) providing multiple polynucleotides (I) derived from MRNAs from a biological sample, where (I) has homology to a known creference sequence (II); (b) expressing (I); and (C) assessing a physical property of the expressing products to determine the sequences of (I) by comparison with the predicted properties of polypeptides encoded by (II). The method is useful for transcript or genetic analysis, especially conformed is useful for transcript or genetic analysis, especially concleic acid analysis where the method comprises expressing polypeptides or nucleic acid analysis where the method comprises expressing polypeptides concleic acid analysis where characteristic of the nucleic acid molecule. The peptide is considerably smaller than the DNA molecule that encodes it individual amino acids averages about 110 Daltons each whereas the cindividual amino acids averages about 110 Daltons each whereas the individual amino acids averages about 110 Daltons each whereas the composed of combinations of 20 different amino acids instead of combinations of 4 different nucleotides, e.g., two random DNA fragments of identical composition (e.g., with 10 adenines, 15 combinations of 4 different nucleotides, e.g., two random DNA fragments of identical composition (e.g., with 10 adenines, 15 combinations of distinguished on the basis of mass, the present sequence represents the coding sequence of human character the method of the invention are adding sequence of human character the method of the invention and average of the invention and a cannot be the invention and a cannot be asset to the coding sequence of human character the method of the invention and average of the invention and an example to the coding sequence of human character the method of the invention and a cannot of the invention and and a cannot be adding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antitumoural phosphodiester oligonucleotide 9 with cytotoxic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                               Transcript, genetic, and especially nucleic acid sequence analysis comprises analysis of hybrid peptide products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

                                                                                                                                                                                                 Novel phosphodiesteric oligonucleotides AAT93811-27 are based on the generic formula, in the 3'-5' or 5'-3' direction: (GaTa')a''-(GbTb')b''-

(GCTC')C''-(GdTd')d''-(GFTe')e''-(GTTE')g''-1', where: N and different from each other; a, b', c', d', e', f', and g' = 0-10, equal or different from each other; a', b', c', d', e', f', and g' = 0-30, equal or different from each other; a', b', c', d', e', f', and g' = 1-

Is different from each other; a', b', c', d', e', f', and g' = 1-

Is dequal or different from each other; The oligonucleotides are believed to selectively bind and sequester some proteins which are essential to the viability and growth of tumours cell ine. They have specific and elective cytotoxic activity against tumour cells, and can be used for treating tumours of the liquid type, in particular of lymphoblastic origin, and of solid type, in particular lymphomas. The present phosphodiester oligonucleotide, at a concentration of 15 micromolar reduced growth of CCRF-CEM tumoural cells by 76%, which is detectable 48 hours after administration. (Updated on 25-MAR-2003 to correct PR field.)

This invention relates to a novel method for the characterisation of the activity of a compound on cell. The method involves receiving images of cells with a cellular activity and images of other cells treated with the compound, quantitatively characterising phenotypic attributes of the cape of cells with a cellular activity to produce a target phenotype for the compound, and comparing the two phenotype for the compound, and comparing the two phenotypes to cher may be useful for characterising cellular activity. The invention cape may be useful for characterising cellular activity. The invention about properties of substances based upon the chiformation about properties of substances based upon the chiformation about properties of substances based upon the cubstances. The invention is also useful for identifying promising candidates in a search for new and better medicines and treatments using multiple biological descriptors from a single cell markers or components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligonucleotides, useful for treating an allergy or asthma, or an autoimmune disease, arthritis, systemic lupus erythematosus, multiple sclerosis, Crohn's disease, or Type 1 diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                          Characterizing cellular activity of compound, by receiving images of cells with known activity and images of cells treated with compound, characterizing phenotypic attributes of images and comparing the

The invention relates to sequence determination oligonucleotides for detecting polymorphic sites in a 5' flanking region of cytochrome P450 ab6 (CYP2D6) gene. CYP2D6 enzymes are involved in the metabolism of many different xenobiotics. Human CYP2D6 gene is located on chromosome 22. The oligonucleotides may be used as in situ hybridisation probes, in ligase-based sequenced determination, as components of diagnostic assays, as probes in sequence determination methods based on mismatches, as hybridisation-based diagnostic assays, and as components of diagnostic microarray. CYP2D6 is useful to predict variations in an individual's ability to metabolise certain drugs. The present sequence is a sense oligonucleotide used for detecting of human CYP2D6 gene 5' flanking chromosome 22; ss. molecules are inhibitory to cell growth. The molecules AA064709, AA064711 and AAQ64724 all lacked cytotoxicity. In the novel 2-5A-antisense oligonucleotide chimeric molecules, the antisense region targets the chimeric molecule region of RNA to be specifically cleaved and the 2',5'-linked terraadenylate tail activates the 2-5A RNase. Typical applications are treatment of viral infections (esp. for cleaved on the 2' strengenome), cancer; leukaemia, cardiovascular disorders (e.g. restenosis after angioplasty), genetic disorders, osteoarchritis or rheumatoid arthritis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Specific cleavage of RNA, useful partic. for treating viral infection, cancers, etc. - by using anti-sense oligo:nucleotide coupled to activator of 2-5A dependent RNase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a polypeptide comprising vascular endochelial-protein tyrosine phosphacase (VE-PTP) or its active fragment or effector, or the nucleic acid encoding the polypeptide or its effector, for use in the manufacture of an agent for monitoring or modulating vascular endothelial-protein tyrosine phosphatase (VE-PTP) or its active fragment or effector, or the nucleic acid encoding the polypeptide or its effector, or the nucleic acid encoding the polypeptide or modulating VE-cadherin mediated processes or disorders.

For monitoring or modulating VE-cadherin mediated processes or disorders, e.g., cancer. The present sequence is a PCR primer shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                         Use of the polypeptide comprising vascular endothelial-protein tyrosine phosphatase (VE-PTP) or the nucleic acid encoding the polypeptide for the manufacture of an agent for monitoring or modulating VE-cadherin mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1. .4

                                                                                          DNAc comprising a promoter P and an L1 cassette sequence having a core retrotransposon element, useful for random insertion of a heterologous or homologous DNA sequence into a cell genome and for correcting genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Creating an insertional mutation in the germ line of an animal, useful for generating a mutation in an offspring of an animal, comprises introducing into an animal a nucleic acid molecule comprising a germ line specific promoter.
                                                                                                                                                                 The present invention relates to DNA for a promoter and an L1 cassette sequence having a core retrotransposon element. The invention is useful for random insertion of a heterologous or homologous DNA sequence into cell genome, and for correction of a genetic defect in the cell into which the insertion is made. Genetic defects which may be corrected includes cystic fibrosis, mutations in the dystrophin gene, genetic defects associated with blood clotting and other genetic defects
                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                      the germ line of an animal by introducing into an animal a nucleic acid molecule comprising a germ line specific promoter. The method is useful for generating a mutation in an offspring of an animal, or for isolating a nucleic acid from a genome of an offspring of an animal. The method may a nucleic acid from a genome of an offspring of an animal. The method may also be used to correct genetic defects in animals, especially humans. The nucleic acid is useful for generating mutations in a cell for assessing the frequency with which selected cells under go insertional mutagenesis for the generation of transgenic animals. This sequence human L1 retrotransposon EN domain.
                                                                                The invention describes a method of creating an insertional mutation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amplifying RNA sequences, useful in detecting diseases or mutation, comprises synthesizing first strand cDNA, circularizing first strand cDNA, and replicating the circularized cDNA molecules by rolling circle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RNA sequences. The method involves synthesising first strand cDNA molecules from RNA molecules, circularising the first strand and replicating the circularised first strand cDNA molecules using rolling circle replication. The method is useful for producing nucleic acid molecules corresponding to RNA molecules in an RNA sample, for identifying or analysing and comparing RNA molecules and or sequences expressed in different cells, tissues and or samples. The invention is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to composition and method for amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

ö
also useful in detecting disease (e.g. cystic fibrosis, muscular dystrophy or diabetes), mutation detection, gene discovery, gene mapping (molecular haplotyping), agricultural research, and assessment of predisposition for cancers, e.g. prostate, breast, lung, colon or owarian cancer. The present sequence is a junction-specific cDNA primer. This sequence is used to illustrate the method of invention.
                                                                                                                                                                                                                                                                                                                                                                      Human interleukin-6 gene; herpes simplex; AIDS; modified; HIV; RSV; HPV; malignancy; hepatitis; inflammation; ss.

The synthetic oligomer is capable of forming a triplex at physiological ph with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human interleuwin 6 gene untranslated sequence contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA cumours and inflammation. The triple helices form under mild conditions the major and inflammation. The triple helices form under mild conditions concitions to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (nucleotides have the 3'positions of xylose sugars linked via the o-concitions and interpretation). Two nucleotides are coupled through a xylene residue to consider stable to nuclease activity. The oligomer is able to inhibit conditions as verified by in vitro systems. The present invention describes a variant human MLH1 or MSH2 gene. Also described are: (1) a method for diagnosing or predicting susceptibility to hereditary non-polyposis colorectal cancer (HNPCC), comprising cereahidates presence of, or susceptibility to HNPCC; (2) a method of identifying mutants in splice donor or acceptor sites of a human MLH1 gene, comprising sequencing splice donor or acceptor sites of the gene with intronic primers for the human MLH1 gene and analysing the sequence to identify any mutants; (3) a method of identifying mutants in splice donor or acceptor sites of a human MSH2 gene, comprising sequencing splice donor or acceptor sites of the gene with intronic primers for the human MSH2 gene and analysing the sequence to identify any mutants; (3) a method of identifying mutants in splice donor or acceptor sites of the gene with intronic primers for the human MSH2 gene and analysing the sequence to identify any mutants; and (4) a transgenic model system for colorectal cancer comprising cells expressing the variant MLH1 or MSH2 gene. The hMLH1 and hMSH2 variants are used to diagnose or determine a patients

CC susceptibility to hereditary non-polyposis colorectal cancer. ABL01648 to ABL01745 and ABL01746 to ABL01831 represent hMLH1 and hMSH2 gene fragments from the present invention and the present invention and the present invention and the present invention of the present invention

Novel isolated scorpion toxin polypeptide, useful for preventing envenomation from scorpion stings, and as vaccine to prevent envenomation from venom of scorpions of genus Centruroides.

Disclosure, SEQ ID NO 285; 135pp; English

This invention relates to novel scorpion toxin polynucleotides and the encoded proteins thereof having any one of 142 fully defined amino acid sequences given in the specification. Specifically, it refers to long chain toxins that block the sodium channels of excitable cells and also chain toxins that affect Erg type potassium channels. The present invention describes immunogenic or antigenic compositions comprising a scorpion toxin protein or fragment thereof, which can be used for the can revent entibodies that are able to bind to and neutralize the in scorpion toxin protein or fragment thereof, which can be used for the compositions or appropriate recombinant fusion proteins in the development of vaccines that can prevent envenomation from stings of scorpions of the genus centruroides. Furthermore, it provides a diagnostic method that uses an immunogenic matrix for the purification of specific immunoglobulins present in a sample that can determine the species of scorpion that has tunny an individual through the detection of identifying antibodies. In addition, it provides methods that are useful for treating envenomation from scorpion stings. This oligonucleotide is an RT-PCR primer used to synthesize cDNA from scorpion toxin total RNA of the invention.

Creating an insertional mutation in the germ line of an animal, useful for generating a mutation in an offspring of an animal, comprises

introducing into an animal a nucleic acid molecule comprising a germ line specific promoter.

Example 2; Fig 14A; 102pp; English.

The invention describes a method of creating an insertional mutation in the germ line of an animal by introducing into an animal a nucleic acid molecule comprising a germ line specific promoter. The method is useful for generating a mutation in an offspring of an animal, or for isolating a nucleic acid from a genome of an offspring of an animal. The method may also be used to correct genetic defects in animals, especially humans. The nucleic acid is useful for generating mutations in a cell for assessing the frequency with which selected cells under go insertional mutagenesis for the generation of transgenic animals. This sequence trapresents an examplary cleavage site of the endonuclease encoded by human L1 retrotransposon EN domain.

Identifying and characterizing gene expression in samples, for identifying mRNAs expressed at different levels, comprises employing an identimer having a oligo-dT primer of a specific sequence and a detectable marker at its 5' end.

Example 2; Page 21; 45pp; English.

The invention relates to systems for identification and characterisation of gene expression in one or more samples, comprising an identimer having a specific oligo-dT primer sequence, where the identimer comprises a detectable marker at its 5' end. The system is useful for identifying any or all genes expressed in a given in vivo or in vitro RNA sample, as well as the relative differences in mRNA between 2 or more samples, where that are expressed at different levels between 2 or more samples. The new system or method addresses limitations of prior methods by comprising compositions and systems that incorporate new strategies where molecular

or biochemical assay compositions and systems are linked to DNA or RNA esquence databases for optimal resource efficiency in assaying gene expression. The system has the following advantages over existing methods: (a) prior sequence information or clone library construction is not needed to enable the assay; (b) provides immediate sequence information in addition to information concerning changes or differences in mRNA level, to determine mRNA expression level and mRNA identification in one assay; (c) generates CDNA fragments from all mRNAs present in the sample for subsequent investigation by common molecular biology techniques; and (d) does not require prior knowledge of the sequence of the genome of the organism under investigation and can be employed in organisms lacking significant genomic sequence in formation. The present sequence represents an oligo dT primer used in the method of the invention

Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.

Example 3; Page 28; 64pp; German.

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML, and predisposis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a

disease-related gene, that are associated with a predisposition to diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion protein (PrP) comprising a polymorphic microsatellite locus.

The target protein is preferably the histamine H2 receptor or one of the proteins which form part of the gastric proton pump. The sequences and methods of the invention are useful in the treatment of gastric reflux, gastritis, dyspopsia, stomach ulcers, duodenal ulcers and other gastric acid disturbances, most of which are caused by Helicobacter pylori
sequence represents a primer used to genotype a region of the cow prion protein (PrP) comprising a polymorphic microsatellite locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating gastric acid disturbance by administering an oligonucleotide which modulates the activity of a polypeptide involved in gastric acid production or secretion.
                                                                                                            Gaps

The present invention provides oligonucleotides, and methods for their use, which are useful in modulating the action of proteins involved in gastric acid production. The target protein is preferably the histamine H2 receptor or one of the proteins which form part of the gastric proton pump. The sequences and methods of the invention are useful in the tracement of gastric reflux, gastritis, dyspepsia, stomach ulcers, duodenal ulcers and other gastric acid disturbances, most of which are caused by Helicobacter pylori
                                                                                                                                                                                                                                                                                                                                  Treating gastric acid disturbance by administering an oligonucleotide which modulates the activity of a polypeptide involved in gastric acid production or secretion.

                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises an electrophoresis apparatus for isolating variant genes. The apiarists consists of: a sealed flow path filled with buffer containing linear polymer and DNA joint controlling agent, and containing DNA conjugate for separation, DNA conjugate for purification, and DNA conjugate for assay; and a heating apparatus for heating the portion of sealed flow path in which the DNA conjugate for assay is fixed. The electrophoresis apparatus is useful for isolating a variant gene. The electrophoresis apparatus is also useful in gene diagnosis for detecting the presence or absence of a gene mutation, or variant gene, and for single nucleotide polymorphism analysis. The present DNA sequence was shown in a figure exemplifying the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                Electrophoresis apparatus useful for isolating variant gene, comprises heating apparatus, and sealed flow path comprising linear polymer and DNA joint controlling agent, with DNA conjugates for separation, purification and assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Electrophoresis apparatus useful for isolating variant gene, comprises heating apparatus, and sealed flow path comprising linear polymer and DNA joint controlling agent, with DNA conjugates for separation, purification

variant genes. The apiarists consists of: a sealed flow path filled with buffer containing linear polymer and DNA joint controlling agent, and containing DNA conjugate for separation, DNA conjugate for purification, and DNA conjugate for assay; and eating apparatus for heating the portion of sealed flow path in which the DNA conjugate for assay is fixed. The electrophoresis apparatus is also useful for isolating a variant gene. The electrophoresis apparatus is also useful in gene diagnosis for detecting the presence or absence of a gene mutation, or variant gene, and for single nucleotide polymorphism analysis. The present DNA sequence was shown in a figure exemplifying the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides the protein and coding sequences of human phosphatidylinositol-3 (PTDINS-3) kinase 35. The sequences can be used in the treatment of cancer, haemopathy, HIV infection, development disorders, immunological diseases and inflammation. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and

This invention relates to a novel method for the characterisation of the activity of a compound on cell. The method involves receiving images of cells with a cellular activity and images of other cells treated with the compound, quantitatively characterising phenotypic attributes of the image of cells with a cellular activity to produce a target phenotype for the cellular activity to produce a target phenotype for the compound, and comparing the two phenotype for determine whether the compound possesses cellular activity. The invention can be useful for characterising cellular activity. The invention about properties of substances based upon the information about properties of substances based upon the information is also useful for identifying promising candidates in a search for new and better medicines and treatments using multiple biological descriptors from a single cell markers or components.
                                                                                                                                                                Characterizing cellular activity of compound, by receiving images of cells with known activity and images of cells treated with compound, characterizing phenotypic attributes of images and comparing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Compound activity characterisation-related oligonucleotide SeqID2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     compound activity characterisation; cellular activity; phenotypic attribute; candidate medicine; candidate treatment; multiple biological descriptor; cell marker; ss.

This invention relates to a novel method for the characterisation of the activity of a compound on cell. The method involves receiving images of cells with a cellular activity and images of other cells treated with the compound, quantitatively characterising phenotypic attributes of the image of cells with a cellular activity to produce a target phenotype for the collular activity to produce a target phenotype for the compound, and comparing the two phenotypes to the cellular activity of a compound, for determine whether the compound possesses cellular activity. The invention may be useful for characterising cellular activity of a compound, for cherming information about properties of substances based upon the information about properties of substances based upon the information about properties of substances based upon the conformation about of living or non-living cells exposed to substances. The invention is also useful for identifying promising candidates in a search for new and better medicines and treatments using multiple biological descriptors from a single cell markers or components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   alysis of cDNA and gene expression - by amplification of mRNA followed digestion with restriction enzymes.
  Characterizing cellular activity of compound, by receiving images of cells with known activity and images of cells treated with compound, characterizing phenotypic attributes of images and comparing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Reverse transcription primer used in cDNA analysis technique.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   mammary-specific protein, designated mammaglobin. The specification describes a protein comprising a mammaglobin antigen that is recognized by B and/or Tc cells specific for the natural, secreted and glycosylated form of mammaglobin polypeptide. This protein, or recombinant vectors that express it, are used in vaccines for treating mammaglobine expressing cancers, specifically of the breast. Such cancers can also be treatted using autologous tumor lymphocytes activated ex vivo with an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mammaglobin antigen, then returned to the patient. Expression of mammaglobin is elevated in 27% of stage I primary breast cancers, so it represents a marker useful for diagnosis of this disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present primer was used to reverse transcribe RNA encoding a human

                                                                                                                                                                                                                                                                                                    This invention describes novel purified aptameric oligonucleotides which have antimicrobial, cytostatic and immunosuppressive activity. The oligonucleotides are useful for binding to and preventing or inhibiting the biological function of a protein kinase or a target molecule and for detecting the presence or absence of a target molecule in biological samples. The oligonucleotides are also useful for prophylactic and therapeutic treatment of diseases such as cancer, autoimmune diseases and diseases caused by pathogenic microorganisms. This sequence represents a primer used in the method of the invention
                                                                                                                                                                                                                                                     Oligonucleotides inhibiting protein kinase, useful for treating diseases such as cancer and autoimmune disease.

The invention relates to a method for enrichment of natural antisense messenger RNA. This method involves generating a population of cDNA from messenger RNA. This method involves generating a population of cDNA from melecules using the generated cDNA to produce double stranded hybrid concludes using DNA polymerase with an exonuclease activity, amplifying concludes using DNA polymerase with an exonuclease activity, amplifying the double stranded molecule using a deoxythymidine (dT) primer and connict the amplified double stranded molecule. This method is useful for enrichment of natural antisense mRNA from any natural source of RNA. It is used to detect whether mRNAs have a natural anti-sense counterpart. The method provides a basis for finding new genes with important cellular regulatory roles or new regulatory information for known genes and provides a starting material for development of an antisense-based provides a starting material for development of an antisense-based the same gene or transcript is involved. The present sequence is KU FOR reverse transcription PCR (RT-PCR) primer used in midogenous antisense mann
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vaccine, cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; fungal infection; parasitic infection; cancer; asthma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         autoantigen sequence. This primer is used in endogenous antisense identification (EASI) procedure for enrichment of natural antisense mRNA
                                                                                                                                                                                                                                                                                          Enrichment and detection of natural antisense mRNA comprises generating double stranded hybrid cDNA using a polymerase with an exonuclease activity, amplifying using a DT primer and cloning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              infectious disease; allergy; immune deficiency; phosphorothioate;

                                                                                                                                                                                                                                                                                               ద
                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxovitidae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), tungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                            ö
                                          Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                            Gaps

molecies optionally extended by a polymerase. The branched chain compounds of the invention are used in nucleic acid synthesis reaction, primer extension reaction, reverse transcription reaction of RNA into DNA, nucleic acid hybridization experiment (for identifying sequence of nucleic acid), and nucleic acid amplification experiment (for analysing the expression pattern of genes). The compounds are also used in solidible invention to produce branched chain compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method of amplifying nucleic acids, involving forming a single-stranded DNA to an mRNA in a sample with a primer, synthesising a DNA strand complementary to the single-stranded DNA to form a double-stranded DNA, adding a single or double-stranded adapter DNA to the double-stranded DNA, adding a single or double-stranded adapter DNA to the double-stranded DNA, and amplifying the DNA strand using a second primer with a nucleic acid sequence in the adapter DNA. This can be used to amplify nucleic acids to monitor mRNA expression, which is applicable in producing e.g. CRNA libraries, CDNA libraries, DNA
                                                                                                                                                                                                                                                                                                                     The specification describes branched compounds containing nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Amplifying nucleic acids with base sequences of mRNAs in sample while sustaining the ratio among them used to monitor mRNA expression, applicable in producing e.g. CRNA library and DNA microarrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                      Branched compounds useful in e.g. nucleic acid synthesis reaction comprises nucleic acid moieties optionally extended by a polymerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid amplification; adapter DNA; human; PCR primer; ss.

The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; procancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; Blaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
microarrays or membrane arrays in gene engineering and gene expression analysis, and in drug development and health maintenance and management. The present sequence is a PCR primer described in the exemplification of the invention

The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigons and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, concert, concert, concert, concert, connective tissue cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, insequencer, luyer cancer, luyer cancer, luyer cancer, lug cancer, lug cancer, lumphoma, non-CC cancer, pancreatic cancer, myeloma, oral cavity cancer, ovarian CC cancer, pancreatic cancer, prostate cancer, tabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of the invention

The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contect dermatisis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                         Immunostimulatory; antiinflammatory; dermatological; antipsoriatic; antiulcer; gene therapy; vaccine; non-allergic inflammatory disease; psoriasis; eczema; allergic contact dermatitis; latex dermatitis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating non-allergic inflammatory diseases, such as psoriasis, ecz allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ds; allergy; asthma; poly-G nucleic acid; aerosol formulation; hypo-responsive subject; immunostimulatory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             performance animal. The method involves determining in sample abundance of expressed target nucleic acid, transmitting digital sample signal to remote diagnostic server; processing digital sample signal at remotely located diagnostic server; processing digital sample signal to remote diagnostic server; processing digital sample signal to remotely located diabase to correlate digital signal with digital information and returning report of particular condition of animal. The method is useful for assessing a condition of a performance animal preferably human, dog or camel. The condition can be an athletic ability and a condition that enhances, hinders, impedes or does not change an expected ability of the performance animal; and also normal, pre-clinical, overt progress and/or stages of disease, undiagnosed of unclassified conditions, presence of drugs, response to environmental conditions. Diseases assessed by the invention include laminitis, lameless, viral or bacterial disease, of gastric ulders, respiratory aliments, fractures, epistaxis, musculoskeletal damage or disorders and joint diseases. The present sequence is a primer used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Assessing condition e.g. athletic ability, stage of disease, presence of drugs, response to exercise, response to vaccines, therapies, nutritional states, of performance animal involves analyzing nucleic acid expression.
                                                                                                                                                                                                                                                                                                                                   Laminitis, viral disease, vaccine, bacterial disease, primer, epistaxis, gastritis, gastric ulcer, respiratory ailment, fracture, joint disease, musculoskeletal damage, ss.
                                                                                                                                                                                                                                                                                      Regular oligo dT primer used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for assessing a condition of a

This method is useful for easy and operable amplification of DNA. The method was carried out by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amplification of DNA maintaining genes and copy number of the sequence on a genome, and their ratios in the resultant DNA fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR primer for amplifying the ATP dependant DNA helicase gene #SEQ ID 69.
                                                                                                                                                                                                                                                                            The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnoshing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                     g and/or preventing allergy or asthma using an immunostimulatory acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA amplification; copy number; polymerase chain reaction; PCR; primer;

nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture reading out, where the nucleic acids are selectively bound using capture cagents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a S'-invariable anchor region, the complement of which is present at chart comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow comprises a sequence of 10-50, particularly 15-25, T residues. The capture capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (b) modecular filaments and binding of single
                                                                                                                                                                                                                                                                                                                           ö

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable constant regions.

Example; Page 6; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using applure agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable and non-variable regions. The capture oligonucleotides at cast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-90, particularly 15-25, T residues. The capture capture oligonucleotides are bictinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular sieve.

```
The present invention relates to methods for the selective enrichment of low abundance polynucleotides. The invention is useful for analysing gene expression in a sample and creating cDNA libraries. The present sequence is reverse transcriptase (RT) primer used in the synthesis of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthesizing double-stranded cDNA, by synthesizing a cDNA strand from RNA template, removing the template and synthesizing double-stranded cDNAs using the cDNA as template in the presence of processive DNA polymerase
                                                                                                         Enriching low abundance polynucleotide relative to a high abundance polynucleotide in a sample, for analyzing gene expression and creating cDNA libraries, comprises blocking polymerase activity on high abundance
                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                       ·,

The present invention relates to a method for synthesising double-

ò

mixture comprising reverse transcriptase, RNA template, and first strain declared comprising reverse transcriptase, RNA template, and first strain declared council extranded cDNAs in a second reaction mixture comprising processive couple. Extranded cDNAs ligase, first CDNA strain as template and random to primers having a mixture of oligonucleotides having random DNA sequences. Also disclosed is a method for amplifying a population of RNA molecules to produce a pool of double-stranded cDNA molecules, and a kit for synthesising double-stranded cDNA. The generated cDNA products are useful in differential quantitative information about the genetic profile of nucleic acid in original RNA sample. The method of the invention is useful in differential gene expression assays for the analysis of diseased and normal tissue and for large-scale correlation studies on sequences, mutations, variants or polymorphisms among samples. The method is efficient in synthesising improved cDNA molecules and effective in generating useful quantities of an amplified CRNA product that comprises a population of CRNA molecules in substantially the same relative molar ratio as the RNA or mRNA starting material. The present sequence stranded cDNA, by synthesising first cDNA strands in a first reaction Sequence 21 BP; 0 A; 0 C; 0 G; 21 T; 0 U; 0 Other;

Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.

Disclosure; SEQ ID NO 912; 235pp; English.

The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an

The invention relates to a novel glycosyltransferase capable of transferring an N-acetyl-D-galactosamine (GalNAC) residue to a GalNAC transferring an N-acetyl-D-galactosamine (GalNAC) residue to a GalNAC creceptor substrate The glycosyltransferase comprises a polypeptide having sequence ADV94808 containing amino acids of 43-601 or 1-601 of a fully defined sequence of 601 amino acids are in the specification, or ADV94808 in which one or more amino acids are comprises: a nucleic acid encoding the 601 amino acid glycosyltransferase protein and comprising a sequence ADV94807 having bases 127-1806 or 1-comprises: a nucleic acid encoding the 601 amino acid glycosyltransferase percification, or a sequence of 1806 base pairs, as given in the specification, or a sequence complementary to the 1806 bp that consists of the base sequence complementary to the 1806 bp complementary sequence; a recomblementary to the 1806 bp cor its complementary sequence; a recomblementary to the 1806 bp cor its complementary sequence; a recomblementary to the 1806 bp cor its complementary sequence; a recombinant containing the vector; an antibody capable of specifically recognizing the glycosyltransferase protein; and a protein; and a ö immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urticaria and acopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the method of the invention. GalNAc Novel glycosyltransferase capable of transferring N-acetyl-D-galactosamine (GalNAC) residue to GalNAC receptor substrate from GalNAC donor substrate, useful in screening substances that promotes/inhibits glycosyltransferase activity. glycosyltransferase; N-acetyl-D-galactosamine; GalNAc; screening; 88; Gaps ö 0.8%; Score 21; DB 1; Length 21; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an oligonucleotide molecule (ON) labeled with several fluorophores of one or more types embedded in its backbone, where one or more of the fluorophores is not located at either the 3' or 5' terminus of ON. ON is useful for sequencing nucleic molecules. ON is
therapeutic agent of the disease caused due to change of activity of the glycosyltransferase, containing an active regulator of the glycosyltransferase protein as an active ingredient. The glycosyltransferase protein is useful in screening substances that promote or inhibit the activity of glycosyltransferase. The glycosyltransferase complementary DNA is useful as a probe for detecting in vivo expression of the glycosyltransferase protein is useful as the therapeutic of the diagnostic for medical studies. The active regulator of the glycosyltransferase protein, is useful as the therapeutic agent for treating the disease caused due to change of activity of the glycosyltransferase protein. The glycosyltransferase protein is capable for transfering dalNAc residue to a GalNAc receptor substrate from a GalNAc donor substrate. This polymuclectide sequence represents a primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel oligonucleotide molecule labeled with several fluorophores, useful for detecting biological molecules e.g., antibody, antigen, avidin or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful for detecting biological molecules e.g., antibody, antigen, avidin, protein, peptide, bacteria, virus, blood cell or hormone. ON is capable of providing strong fluorescence signals at different wavelengths. This sequence corresponds to an example of an oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to a complex (CI) comprising a first and second single stranded nucleic acid or its derivative and a metal ion, where the first and second base of the strands forms a bond with metal ion, where the included are detecting the existence of thymine-thymine, cytosine. Also circled are detecting the existence of thymine-thymine, cytosine cytosine-thymine base pair in a DNA or its analog (involving comparing DNA or its analog in an aqueous medium, processing the solution for 3 minutes, to obtain three DNA solutions, dissolving Hg(II)2+, Ag+ and combinations of Hg(II)2+ and Ag+ in the prepared DNA solutions, and comparing the existence of T-T base pair, C-C base pair and C-T base comparing the existence of T-T base pair, C-C base pair and C-T base comparing the existence of T-T base pair, C-C base pair and C-T base comparing the characteristic of metal binding region, where the coupling of metal ion (comprising one or more DNA molecules or their analogs having a metal binding region, where the coupling of metal ion is detected by analyzing the characteristic change in DNA). The complex (CI) is useful as a non-Watson Crick base pair in a double stranded DNA. The complex (CI) enables to detect non-Watson Crick base pair in a double stranded DNA. The complex (CI) enables to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Human KU70 transcript siRNA antisense oligonucleotide siRNA2.

(first entry)

28-JUL-2005

ADZ98948;

```
The invention relates to interfering with transcription at a target site in a latent virus in a host cell. The method comprises producing an coligonucleotide capable of forming a triplex with the target site, coupling the oligonucleotide to a compound (A) capable of introducing transcription relations in the viral genome, introducing the coupled oligonucleotide, and reducing viral transcription from the target site. The method is used for interfering with transcription at target site in a latent virus, e.g. herpes viruses, UC virus, adenovirus, papillomavirus and HIV, and poxviruses, e.g. cowpox, monkeypox, camelpox, vaccinia, and variola in a host cell, and for effective anti-latency therapy to prevent recurrences and halt progression of harpes keratitis or genital herpes. The method enables control and prevention of infection through molecular transcriptional inhibition. The current sequence cepresents a triplex oligo (TFO) that binds target sequences in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Interfering transcription at target site in latent virus in host cell for treating viral infections comprises introducing triplex-forming oligonucleotide coupled to compound that introduces transcriptionaltering mutations in viral genome.
                                                                                                                                      Virucide; anti-HIV; viral transcription; inhibitor; infection;
herpes keratitis; genital herpes; ds.

```

```
The invention relates to a method for modulating, in a host cell, a protein protein interaction between a first protein which is PRAK (P189-cepulated/activated protein kinase or MARKARKS) and a second protein which is ERK3 (extracellular signal-regulated kinase 3). The method comprises administering to the cell a compound capable of modulating the protein-protein interaction. The method is useful in modulating in a host protein-protein interaction between a first protein which is PRAK and a second protein which is ERK3 for treating inflammation or inflammatory disorders, e.g., asthma, rheumatoid arthritis, quositis, Crohn's disease, gastritis, colitis, culcrative colitis, inflammatory bowel disease, proctitis, pelvic inflammatory disease, systemic lupus erythematosus, rhinitis, conjunctivitis, dermitis, dermitis or eczema. The present sequence represents an siRNA (short inferfering RNA) oligonucleotide targeting the KU70 transcript, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modulating, in a host cell, a protein-protein interaction between first protein, PRAK, (MAPKAPKS) and second protein, ERK3, (extracellular signal-regulated kinase 3) by administering modulating compound.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modulating, in a host cell, a protein-protein interaction between first protein, PRAK, (MAPKAPK5) and second protein, ERK3, (extracellular signal-regulated kinase 3) by administering modulating compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for modulating, in a host cell, a protein-protein interaction between a first protein which is PRAK (P38-regulated/Activated protein kinase or MAPKAPK5) and a second protein which is ERK3 (extracellular signal-regulated kinase 3). The method comprises administering to the cell a compound capable of modulating the protein interaction. The method is useful in modulating in a host

The invention relates to a method for modulating, in a host cell, a protein-protein interaction between a first protein which is PRAK (P38-crequiated/activated protein kinase or MAPKARK5) and a second protein which is ERK3 (extracellular signal-regulated kinase 3). The method comprises administering to the cell a compound capable of modulating the protein-protein interaction. The method is useful in modulating in a host cell a protein-protein interaction between a first protein which is BRAK for treating inflammation or inflammatory disorders, e.g., asthma, rheumatoid arthritis, upositis, chronic arthritis, wyositis, Crohn's disease, proctiis, pelvic inflammatory disease, systemic lupus erythematosus, rhinitis, conjunctivitis, soleritis, chronic inflammatory disease, systemic lupus erythematosus, rhinitis, conjunctivitis, soleritis, chronic inflammatory polyneuropathy, Tertiary conjunctivitis, soleritis, chronic inflammatory polyneuropathy, Tertiary changes as psoriasis, dermatitis or eczema. The present sequence represents an sirNak (short interfering RNA) oligonucleotide targeing the KU70 transcript, which is used in the exemplification of the present
          Modulating, in a host cell, a protein-protein interaction between first protein, PRAK, (MAPKAPKS) and second protein, ERK3, (extracellular signal-regulated kinase 3) by administering modulating compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method (M1) for labeling double stranded nucleic acid for efficient detection of DNA or RNA. The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Labeling double stranded nucleic acid, involves utilizing carbodismide derivative for labeling thymine, uracil and guanine, which exists in mismatch region of nucleic acid or unstable region of hydrogen bond of nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotide #8 used to illustrate nucleic acid labeling method.

ö present invention relates to a method for augmenting T-helper 1 cells Immunostimulant; Antiinflammatory; Antipsoriatic; Gastrointestinal-Gen.; Antiulcer; Dermatological; Antiallergic; helper T-lymphocyte; immune stinulation; inflammation; psoriasis; inflammatory bowel disease; Crohns disease; ulcerative colltis; eczema; skin allergy; contact dermatitis; ss; phosphorothioate. (Thi)-like immune activation in a subject. The method comprises administrating an immunostimulatory nucleic acid (1) to induce Thi-like immune activation; and administrating a cyclooxygenase inhibitor (II) to inhibit prostaglandin expression, is new. The present sequence is one such immunostimulatory nucleic acid. (1) is useful for treating non-allergic inflammatory diseases such as psoriasis, inflammatory bowel diseases (Crohn's disease and ulcerative colitis), eczema, allergic Use of an immunostimulatory nucleic acid and a cyclooxygenase inhibitor to augment T-helperl cells like immune activation and to treat non-allergic inflammatory diseases, e.g. psoriasis and Crohn's disease. comprises using a carbodismide derivative for labeling one or more of thymine, uracil and guanine, which exists in the mismatch region of the double stranded nucleic acid or its vicinity, or unstable region of the hydrogen bond of the double stranded nucleic acid. (M1) is useful for labeling double stranded or single stranded nucleic acid or detecting single nucleotide polymorphisms. The present sequence was used to illustrate the method of the invention. The new invention relates to preparing DNA fragments comprising sequences corresponding to two opposite end regions of a linear nucleic acid molecule, by creating a linear DNA molecule from a nucleic acid molecule, conference to two opposite ends of the linear DNA molecule, digesting the DNA molecule, circularizing the linear DNA molecule, digesting the circular DNA molecule, and endonuclease, and isolating the DNA fragment. Also described are a vector pGSC; obtaining (M2) information on the end sequences of a linear nucleic acid, comprising preparing DNA fragments by (M1), preparing a concatemer by ligating the DNA fragments by cother, and sequences of the linear nucleic; and priming (M3) a reverse cother, and sequences of the linear nucleic; and priming (M3) a reverse cother searched overhanging region, where the single-stranded overhanging region, where the single-stranded overhanging region, where the single-stranded overhanging region, to the single-stranded overhanging region, to the complementary 3 end sequence of the RNA; and letting the free 3'-end of the overhanging region of the linker prime a reverse transcription reaction over the RNA with a creverse transcription and letting the free 3'-end of the overhanging region of the linker prime a reverse transcription and expression profiling and for studies or biological system, characterization of genetic elements and analysis the expressed genes. The identified DNA fragments are useful in drug development, diagnostics or forensis ctudies. The present sequence is and proly. A prail removal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           opposite end regions of linear nucleic acid, for e.g. analysis, comprises ligating linkers, circularizing, and digesting.

interleukin 6 gene untranslated sequence contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region corned from an o-xyloso dimer synthon. The linking gp. is o-xyloso (nucleotides have the 3 positions of xylose sugars linked via the o-xylose ting). Two nucleotides are coupled through a xylene residue to contain the dimer synthon. This additional modifications may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Seguence 23 BP; 0 A; 2 C; 0 G; 21 T; 0 U; 0 Other;

Novel method of stabilizing duplex formation, or destabilizing non-specific duplex formation using primer containing modified nucleotide analogs, useful for preventing mispriming during PCR, RACE, DNA synthesis or sequencing

Example 1; Page 25; 46pp; English

The present invention describes a method for destabilising non-specific

The invention relates to systems for identification and characterisation

of gene expression in one or more samples, comprising an identimer having

a specific oligo-dT primer sequence, where the identimer comprises a

catectable marker at its 5' end. The system is useful for identifying any

cat all genes expressed in a given in vivo or in vitro RNA sample, as well

cas the relative differences in mRNA between 2 or more samples, where

cate expressed at different levels between 2 or more samples. The new

cystem or method addresses limitations of prior methods by comprising

compositions and systems that incorporate new strategies where molecular

compositions and systems that incorporate new strategies where molecular

compositions and systems that incorporate electrons are linked to DNA or RNA

sequence databases for optimal resource efficiency in assaying gene

expression. The system has the following advantages over existing

methods: (a) prior sequence information or clone library construction is ö duplex formation, between an oligonucleotide and a target nucleic acid (NA), comprising incubating the target NA with a modified oligonucleotide (I) comprising a homopolymeric sequence having a modification which decreases or abrogates H-bonding between the modified oligonucleotide and the non-specific target NA. The modified oligonucleotide is used to improve discrimination between the targeted homopolymeric sequence and a non-homopolymeric target sequence. It is used to increase the proportion of full length cDNA clones for a library, to reduce mispriming during sequencing, 5, or 3, RACE (rapid amplification of CDNA ends) or DNA synthesis or to generate bona fide genetic markers. The present sequence represents an oligonucleotide which is used in the exemplification of the Identifying and characterizing gene expression in samples, for identifying mRNAs expressed at different levels, comprises employing an identimer having a oligo-dT primer of a specific sequence and a detectable marker at its 5' end. The invention relates to systems for identification and characterisation of gene expression in one or more samples, comprising an identimer having a specific oligo-dT primer sequence, where the identimer comprises a catectable marker at its 5' end. The system is useful for identifying any or all genes expressed in a given in vivo or in vitro RNA sample, as well as the relative differences in mRNA between 2 or more samples, where the desired, for supporting discovery of new genes, and for identifying mRNAs that are expressed at different levels between 2 or more samples. The new system or method addresses limitations of prior methods by comprising compositions and systems that incorporate new extrategles where molecular or biochemical assay compositions and systems are linked to DNA or RNA sequence databases for optimal resource efficiency in assaying gene expression. The system has the following advantages over existing methods: (a) prior sequence information or clone library construction is not needed to enable the assay; (b) provides immediate sequence information in addition to information concerning changes or differences
                                                                                                                                                                                                                                                                                                         ö
not needed to enable the assay; (b) provides immediate sequence information in addition to information concerning changes or differences in mRNA level, to determine mRNA expression level and mRNA identification in one assay; (c) generates CDNA fragments from all mRNAs present in the sample for subsequent investigation by common molecular biology the chinques; and (d) does not require prior knowledge of the sequence of the genome of the organism under investigation and can be employed in organisms lacking significant genomic sequence in formation. The present sequence represents an oligo dT primer used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying and characterizing gene expression in samples, for identifying mRNAs expressed at different levels, comprises employing an identimer having a oligo-dT primer of a specific sequence and a detectable marker at its 5' end.

Generating a mutation in a gene using a dominant negative allele of a mismatch repair gene which results in mismatch repair deficiency in cells containing the allele is useful in gene and drug target discovery and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to methods for generating a mutation in a gene of interesting using a dominant negative allele of a mismatch repair gene (I-MMR) under control of an inducible transcriptional regulatory element (ITRE). The invention is useful to provide new cell lines that can be used for gene discovery, drug target discovery, recombinant gene mutagenesis or recombinant protein production. The present sequence is a polyPNP (purine phosphorylase) out-of-frame polyA tract DNA
Dominant negative alleles of human mismatch repair genes can be used to generate hypermutable cells and organisms. They increase the rate of spontaneous mutations by reducing the effectiveness of DNA repair and thereby render the cells or animals hypermutable. The method is used to produce genetically altered organisms to produce new output traits. The present sequence is a bacterial poly purine nucleotide phosphorylase (polyPNP) DNA fragment containing an out-of-frame polyA tract. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dominant negative allele; mismatch repair gene; D-MMR; gene discovery; ITRE; inducible transcriptional regulatory element; recombinant gene mutagenesis; recombinant protein production; drug target discovery; ds.

The method of the invention demonstrates cytostatic activity and may be useful for identifying a risk of, preventing and/or treating breast cancer and cancer metastasis. The methods may be utilized for gene therapy or RNA interference. The current sequence is that of an Extend primer of the invention which was used to genetype a human intercellular adhesion molecule (ICAMI, ICAMA, ICAMS) region single nucleotide polymorphism

The invention relates to human gonadotropin-releasing hormone 10 (AAM49158) and to nucleic acids encoding it (ABL55128). The protein has a molecular weight of 10 kb. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antegonist in therapeutic applications. Gonadotropin-releasing hormone 10 can be used in the treatment of a variety of diseases such as cancer and HIV (human immunodeficiency virus) infection. Sequences ABL55129-ABL55130 represent reverse transcription-pck (RT-PCR) primers used in an exemplification of the invention to isolate human gonadotropin-releasing hormone 10 cDNA
    Human, gonadotropin-releasing hormone 10, recombinant production, cancer, HIV infection, human immunodeficiency virus, gene therapy, cytostatic, anti-HIV, reverse transcription-PCR, RT-PCR, primer, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polypeptide-human gonadotropin-releasing hormone 10 and polynucleotide encoding it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 20.8; DB 1; Length 24; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human phosphatase 79 (AAB73700), nucleic acids encoding it (AAH24264), and a method for the recombinant production of human phosphatase 79. The present invention additionally discloses an agonist of phosphatase 79 for therapeutic use, and an antibody which specifically binds to human phosphatase 79. Human phosphatase 79, and nuclectides which encode it may be used for treating a variety of nuclectides which encode it may be used for treating a variety of immunodeficiency virus) infection, immune disorders and inflammatory conditions. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide can be used as a primer for nucleic acid amplification reaction or as a probe for hybridisation reactions, or in producing gene chips or microarrays. Sequences AAH24265-AAH24266 represent reverse transcription-per (1902) primers used in an exemplification of the invention to solate human phosphatase 79 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human phosphatase 79 and encoded polynucleotide, applicable in diagnosis and treatment of malignant tumor, hemopathy, HIV infection, immunological diseases and various inflammation.
                                                                                                                                                                                 Phosphatase 79; human; BAC clone CTB-54D4-encoded protein homologue, recombinant production; malignant tumour; cancer; blood disease; HIV infection; human immunodeficiency virus; immunoder; inflammatory condition; oytostatic; anti-HIV; antiinflammatory; immunomodulator; reverse transcription-PCR; RT-PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human gonadotropin-releasing hormone 10 RT-PCR primer, SEQ ID NO:4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .;
